

Hello ,

At PlektonLabs, we've always believed integration isn't just a technical discipline; it's a way of thinking. The world's best leaders don't just manage systems; they design connections. Between teams. Between data and insight. Between vision and execution.

This month, we're looking at integration as a leadership mindset. Because real transformation doesn't start in a data flow, it starts in how leaders think about collaboration. The future belongs to organizations that move as one, where every department, tool, and process works in sync toward a shared purpose.

That's what we build as a company: connected enterprises that adapt faster, scale smarter, and create real impact. Whether through API-led architectures, Salesforce and MuleSoft solutions, or strategic integration consulting, our goal is to help businesses think and act as one.

Integration isn't just what we do; it's how we lead. Because when technology and leadership move in sync, innovation follows naturally.

In this issue, we're sharing stories and insights from across our ecosystem, where strategy meets systems and leadership meets connection. Scroll down to explore how organizations are rethinking integration, building resilience, and leading with purpose.

Integration as A Leadership Mindset

An integration mindset means seeing connections between teams, processes, and ideas. It's empathy translated into architecture. The best CIOs and CEOs share one trait: they integrate, by instinct.

INSIDE PLEKTONLABS

Dreamforce 2025

San Francisco became the epicenter of innovation from October 14-16. Dreamforce 2025 sparked bold ideas, insightful conversations, and real-world demonstrations of integration and AI in action.

Wahid Mohammad, CEO of PlektonLabs, attended to connect with industry leaders and discuss how integration excellence is reshaping customer experience and operational agility.

Key takeaways:

- **The shift to the “Agentic Enterprise” took centre stage:** Businesses are now expected to integrate scalable AI agents, unified data, and smart workflows to unlock new capabilities.
- **Architecture is changing:** Organisations must evolve beyond legacy stacks to support AI-driven layers, a unified data fabric, and orchestration across humans and machines.
- **Data and governance matter more than ever:** Speed’s not enough if your data foundations aren’t trusted and transparent.
- **Integration is not optional:** It’s essential. From unified platforms to embedded AI across Sales, Service, Marketing, and more, companies that integrate deeply win.

For IT and integration leaders, the message is clear: focus on integration, automation, and smart workflows to turn these innovations into tangible results.

Srilatha Yadavalli

Senior Integration Engineer, PlektonLabs

This month, we're shining the spotlight on **Srilatha**, one of our talented **Senior Integration Developers at PlektonLabs**. She brings a thoughtful, problem-solving mindset to every project, and a touch of rock-energy when the work gets tough.

In her role, Srilatha works closely with clients to understand their goals and turn them into seamless MuleSoft solutions. Her days blend stakeholder discussions, API design and coding, and plenty of collaboration with other developers and architects to ensure everything runs smoothly across systems.

When faced with a complex challenge, she takes a calm, step-by-step approach: "I break the problem down, analyze the data flow, check logs and configurations, and isolate the issue

before moving toward a clean fix". Her advice for anyone getting started in integration? Learn APIs inside out, master DataWeave, and stay curious.

What she loves most about PlektonLabs is **the people and culture**. "Everyone here is open to sharing knowledge and helping each other grow. It's a place that really encourages learning and innovation".

And when she needs to reset her focus, Srilatha has a unique ritual: cranking up loud, fast-paced music to clear her mind and spark new ideas!

LET'S TRANSFORM TOGETHER
